

Cover Letters — for roles you can actually win

Three ready letters plus a reusable master. Replace **[LIVE URL]** placeholders once your projects are deployed — do not send with empty brackets.

LETTER 1 — Canonical, Junior Software Engineer (Ubuntu) * your best international shot

Read this first. Canonical asks for "an undergraduate degree in Computer Science or STEM, **or a compelling narrative about your alternative path.**" That second clause is written for someone exactly like you — but it means the letter has to *do work*. They also weight **high-school academic results** unusually heavily, and ask for them in the application form. Your **GPA 5.00/5.00 in both SSC and HSC** is a genuine competitive asset here, which is almost never true elsewhere. Answer every academic question on their form fully — leaving them blank is the main reason strong candidates get filtered.

Dear Canonical Hiring Team,

I'm applying for the Junior Software Engineer, Ubuntu role. I don't yet hold a university degree, so let me address that directly — and then show you what I've built instead.

*I finished my Higher Secondary Certificate in 2025 with a **GPA of 5.00 out of 5.00**, after the same result in my Secondary School Certificate in 2023, and I hold **IELTS Band 7.0**. Alongside school, I taught myself backend engineering and have spent the last three years building and deploying software rather than only studying it.*

*That work now totals **15+ deployed web applications**, built with Python (Django, Django REST Framework, FastAPI) and PostgreSQL/MySQL. Critically for this role, I deploy and operate them myself on Linux: **Docker containers behind Nginx and Unicorn**, with environment configuration, process supervision, static-file serving and log-based debugging all handled by me. Before that I spent two years as the computer lab assistant at my school, maintaining workstations and the lab network and resolving OS and connectivity faults daily. Linux administration and system debugging aren't coursework topics for me — they're how I get my own code running.*

*I'm currently completing the **Cisco Networking Academy** track and **Let's Defend's Detecting Web Attacks** course, and I've finished the Mastercard cybersecurity and Skyscanner frontend job simulations through Forage.*

Open source is the reason I could learn any of this. Every framework I build on was given away by people who didn't know me, and contributing to Ubuntu would be the most direct way I can think of to pay that forward.

*My code is public at **github.com/mhjahed**, and I'd welcome any technical assessment you set.*

Thank you for considering an unconventional application.

***Moksood Hossen Jahed** Sylhet, Bangladesh (GMT+6) · jahedff271@gmail.com · +880 1805 547360

LETTER 2 — MazeGeek Inc., Software Engineer (Backend) — BD remote, BDT 50-80k/month

Dear MazeGeek Hiring Team,

I'm applying for the Software Engineer (Backend) position. I'm a backend developer based in Sylhet, working remotely and available immediately.

For the past three years I've independently built and deployed **15+ web applications**, designing scalable APIs and the data models underneath them. The work most relevant to your enterprise data-access APIs:

- **REST API design** — 20+ endpoints across product, order, and user-role management, built with Django REST Framework using token authentication and role-based permissions - **Database architecture** — relational schemas in PostgreSQL and MySQL, including transaction-scoped writes to keep inventory and order state consistent under concurrent load - **Cloud and deployment** — Dockerised services on Linux behind Nginx and Gunicorn, version-controlled in Git with documented setup

Live examples: [LME URL 1] · [LME URL 2] · Code: github.com/mhjahed

I hold **IELTS 7.0**, so I can work comfortably in an English-speaking distributed team and write the kind of clear API documentation that enterprise integration work depends on.

I'd be glad to complete a technical assessment.

Best regards, **Moksood Hossen Jahed** · jahedff271@gmail.com · +880 1805 547360 · github.com/mhjahed

LETTER 3 — Bdtask Ltd, Junior Software Engineer (Python/Django) — Dhaka

Dear Bdtask Hiring Team,

I'm applying for the Junior Software Engineer (Python/Django) position.

Your listing asks for at least six months of project experience in Python, Django, REST APIs, Git and deployment. Over the past three years I've independently built and deployed **15+ applications** covering exactly that ground:

- **Django + DRF** — multi-role e-commerce platform with 4 user types, separate dashboards, real-time order tracking and 20+ REST endpoints - **Production deployment** — Docker, Nginx and Gunicorn on Linux servers, with CI/CD fundamentals and Git/GitHub throughout - **Databases** — PostgreSQL, MySQL and SQLite across e-commerce, POS, medical and education systems

Live: [LME URL 1] · [LME URL 2] · Code: github.com/mhjahed

One project I'd particularly like to discuss is a POS and inventory system I built for retail shops. Stock deduction runs inside database transactions so counts stay correct when several invoices are created at once, and the whole system runs on a local server because shop internet here is unreliable. It taught me that the right architecture is the one that survives the actual environment.

I hold **IELTS 7.0**, I'm continuing with AWS and testing practices, and I can join immediately in Dhaka or remotely. I'd welcome a coding test.

Thank you for your time, **Moksood Hossen Jahed** · jahedff271@gmail.com · +880 1805 547360

MASTER TEMPLATE — adapt to any junior backend role in 5 minutes

Swap the four bracketed parts. Keep it to four paragraphs and under 300 words.

Dear [Company] Hiring Team,

I'm applying for the [exact role title] position. I'm a backend developer working in Python (Django, DRF, FastAPI), available immediately from Sylhet, Bangladesh (GMT+6).

Over the past three years I've independently built and deployed 15+ web applications, owning the full path from database schema to REST API to Linux deployment with Docker, Nginx and Gunicorn.

[Pick the 2 requirements from their listing you match best and evidence each with one concrete detail — a number, a technology, a decision you made.]

[One short paragraph on why THIS company — their product, their stack, something specific from the listing. Two sentences. Never generic praise.]

Code: github.com/mhjahed · Live: [LME URL]. I hold IELTS 7.0 for async remote collaboration, and I'd welcome any technical assessment.

Best regards, **Moksood Hossen Jahed** · jahedff271@gmail.com · +880 1805 547360

The four rules that make these work

- 1 Never open with "I am writing to apply for..."** — it wastes the only line they're sure to read.
- 2 Address your biggest weakness head-on in the first paragraph** when it's unavoidable (the degree). Naming it defuses it; hiding it makes it the reason you're rejected.
- 1 One specific engineering decision beats five adjectives.** The transaction detail in the POS story does more than any amount of "passionate and hardworking."
- 1 Always end with an offer to be tested.** It's the strongest move available to someone without formal credentials — you're inviting them to check.
